

Covenant Wealth Website Setup Guide

Step-by-step instructions for beginners: GitHub, GitHub Pages, custom domain, and Codex.

Website	www.cowealth.com
Built for	Entrepreneurs, churches, ministries, investors, and donors
Code style	Plain HTML, CSS, and JavaScript - no complicated framework

Use this guide in order. Do not jump to Codex before the site is uploaded to GitHub and published through GitHub Pages.

This guide assumes you are starting from the ZIP file called covenant-wealth-site-v2-with-guide.zip.

1. What You Are Building

You are setting up one Covenant Wealth website with three clear audience pathways. The goal is a public site that is clean, credible, and easy to update before adding advanced features.

- Main site: www.cowealth.com
- Entrepreneurs page: www.cowealth.com/entrepreneurs/
- Churches page: www.cowealth.com/churches/
- Investors page: www.cowealth.com/investors/

The site is intentionally simple. Do not let Codex convert it into React, Next.js, Tailwind, or a database application unless you intentionally decide to rebuild later.

2. Understand the Files

File or folder	What it does
index.html	Main homepage
styles.css	Website design, colors, spacing, and mobile layout
script.js	Small interactive features, including the mobile menu
entrepreneurs/index.html	Page for entrepreneurs
churches/index.html	Page for churches and ministries
investors/index.html	Page for investors, donors, and capital partners
CNAME	Tells GitHub Pages to use www.cowealth.com
README.md	Project notes
codex-instructions.md	Safe prompts and rules for Codex
STEP_BY_STEP_FOR_DUMMIES.md	Beginner setup guide in editable text form

3. Create the GitHub Repository

- 1 Sign in to GitHub or create a GitHub account.
- 2 Click the plus sign + near the top-right.
- 3 Click **New repository**.
- 4 Name the repository **covenant-wealth-site**.
- 5 Choose **Public** for the easiest GitHub Pages setup.
- 6 Click **Create repository**.

A repository is just an online project folder. This is where the website code will live.

4. Upload the Website Files

- 1 Open the new **covenant-wealth-site** repository.
- 2 Click **Add file**.
- 3 Click **Upload files**.
- 4 Unzip the website folder on your computer.
- 5 Drag the website files and folders into GitHub.
- 6 Scroll down and enter the commit message: **Add Covenant Wealth website files**.
- 7 Click **Commit changes**.

Make sure index.html is at the top/root level of the repository. If index.html is buried inside an extra folder, GitHub Pages may not publish correctly.

Files you should see after upload:

```
index.html
styles.css
script.js
CNAME
README.md
codex-instructions.md
STEP_BY_STEP_FOR_DUMMIES.md
entrepreneurs/
churches/
investors/
```

5. Turn On GitHub Pages

GitHub Pages turns your repository into a live website.

- 1 Inside the repository, click **Settings**.
- 2 On the left side, click **Pages**.
- 3 Under **Build and deployment**, choose **Deploy from a branch**.
- 4 Under **Branch**, choose **main**.
- 5 For the folder, choose **/root**.
- 6 Click **Save**.
- 7 Wait a few minutes for GitHub to publish the site.

Your temporary site link will look like this:

```
https://YOUR-GITHUB-USERNAME.github.io/covenant-wealth-site/
```

Test the homepage and all three audience pages before touching the custom domain.

6. Connect www.cowealth.com

Only do this step if you own or control the domain **cowealth.com**.

In GitHub:

- 1 Go to your repository.
- 2 Click **Settings**.
- 3 Click **Pages**.
- 4 Under **Custom domain**, enter **www.cowealth.com**.
- 5 Click **Save**.
- 6 Turn on **Enforce HTTPS** once GitHub allows it.

In your domain provider account, create this DNS record:

Type	Name	Value
CNAME	www	YOUR-GITHUB-USERNAME.github.io

Example: if your GitHub username is joshuagithubname, the value should be **joshuagithubname.github.io**. DNS can take minutes or several hours to update.

7. Connect GitHub to Codex

Codex needs access to your GitHub repository so it can read and edit the website files.

- 1 Open ChatGPT.
- 2 Go to settings, apps, connectors, or integrations.
- 3 Find **GitHub**.
- 4 Connect your GitHub account.
- 5 Allow access to **covenant-wealth-site**.
- 6 Open Codex.
- 7 Choose the **covenant-wealth-site** repository when Codex asks what project to work on.

Do not ask Codex to rebuild the site yet. First ask it to review the existing code safely.

8. First Prompt to Give Codex

Copy and paste this into Codex:

Review this Covenant Wealth static website repository. Keep it beginner-friendly using plain HTML, CSS, and JavaScript. Do not convert it to React, Next.js, Tailwind, or another framework unless I explicitly ask.

Check the homepage, entrepreneur page, church page, and investor page for layout consistency, mobile responsiveness, accessibility, and SEO basics. Make only safe improvements and summarize every file changed.

9. How to Ask Codex for Changes

Give Codex small, specific requests. Big vague requests create messy code.

Good prompt	Update the Entrepreneurs page to make the call-to-action stronger. Keep the design consistent with the rest of the site. Do not change the site structure.
Good prompt	Add a short FAQ section to the Churches page with 4 questions and answers. Keep it simple and mobile-friendly.
Bad prompt	Make it amazing.
Bad prompt	Rebuild everything however you want.

10. Before Accepting Codex Changes

- Does the homepage still load?
- Do the Entrepreneurs, Churches, and Investors pages still open?
- Does the mobile menu work?
- Did Codex keep the site as plain HTML, CSS, and JavaScript?
- Did Codex explain what files it changed?
- Did Codex preserve the Covenant Wealth tone and mission?

If Codex overcomplicates the project, paste this:

```
Undo the framework conversion. Keep this as a simple static website using HTML, CSS, and JavaScript only.
```

11. Your Do-This-First Checklist

Done	Task
☐	Create a GitHub account.
☐	Create the covenant-wealth-site repository.
☐	Upload index.html, styles.css, script.js, and all folders.
☐	Turn on GitHub Pages.
☐	Open the temporary GitHub Pages site.
☐	Test the homepage.
☐	Test /entrepreneurs/.
☐	Test /churches/.
☐	Test /investors/.
☐	Connect www.cowealth.com in GitHub Pages.
☐	Add the CNAME DNS record with your domain provider.
☐	Connect GitHub to Codex.
☐	Give Codex the first review prompt.
☐	Review Codex changes before accepting them.

12. What Not to Build Yet

Do not add these until the public site is live, clear, and tested:

- Login system
- Payment processing
- Member dashboard
- Course platform
- Database
- Complicated React or Next.js app
- AI chatbot
- CRM integration

Those are phase two. First, get the public site clean, clear, and live.

13. Emergency Fixes

Problem	Likely fix
The site does not load	Check that index.html is in the repository root, not buried inside another folder.
The custom domain does not work	Wait longer for DNS, then check the CNAME record for www.
Codex cannot see the repository	Check GitHub connector permissions and repository access.
The site looks broken after Codex edits it	Ask Codex to restore the previous working layout and keep only safe copy edits.

Final reminder: the first win is not a perfect website. The first win is a live, credible website that clearly routes entrepreneurs, churches, and investors to the right page.
